

Use what you know about the Earth's movement to explain the following observations.

- 1) The Sun looks as if it is moving in the sky.
- 2) Day and night happen in a repeated cycle.

The Earth rotates on its axis once every twenty four hours which causes night and day.

The way the Earth rotates makes it look as if the Sun is moving. However, the Sun stays still and the Earth orbits around it.

What else do you know about the movement of the Earth?
